Health Inequalities and Social Determinants of Health

Health Inequalities

Health inequalities refer to differences in health outcomes or status between different populations or groups. These differences are often due to social, economic, and environmental factors rather than biological or genetic reasons. Health inequalities are a critical issue in public health as they highlight disparities in health that are unjust and avoidable. Addressing health inequalities involves understanding and tackling the root causes of these disparities, such as poverty, discrimination, lack of education, and inadequate access to healthcare.
